DETAILED ACTION

Claim Rejections - 35 USC § 102

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

- (e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.
- 1. Claims 1,6 and 11 are rejected under 35 U.S.C. 102(e) as being anticipated by Gray et al. (US 6,275,712B1).

Regarding claims 1,6 and 11, Gray et al. discloses a computer program, a method and a battery operated user equipment for use in a radio telecommunications network, including means for monitoring the state of charge of the battery (fig. 1, battery monitor 26) and means for communicating state of charge data to a base station (see col. 2, lines 14-67).

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

Art Unit: 2681

2. Claims 2-3 and 7-8 are rejected under 35 U.S.C. 103(a) as being unpatentable over Gray et al. (US 6,275,712B1) in view of Goetz et al. (US 6,349,204 B1).

Regarding claims 2-3 and 7-8, Gray et al. does not disclose including a data store and means for configuring the equipment to receive files automatically and store them in the data store, or to retrieve files from the data store and transmit them, without activating any sounder or vibrator for alerting the user; including means for monitoring the available data storage capacity of the data store and communicating available storage capacity data to the base station.

However, Goetz et al. discloses a data store and means for configuring the equipment to receive files automatically and store them in the data store (see col. 4, lines 34-41; fig. 1; monitoring & control 6; col. 6, lines 4-14, lines 28-32), or to retrieve files from the data store and transmit them, without activating any sounder or vibrator for alerting the user; means for monitoring the available data storage capacity of the data store and communicating available storage capacity data to the base station (see col. 4, lines 34-41; fig. 1; monitoring & control 6; col. 6, lines 4-14, lines 28-32).

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to provide above teaching of Goetz to Gray et al so that files downloaded can be stored in the user's equipment to avoid re-downloading.

3. Claims 4 and 9 are rejected under 35 U.S.C. 103(a) as being unpatentable over Gray et al. (US 6,275,712B1) in view of Goetz et al. (US 6,349,204 B1) and further in view of Brown et al. (US 6,185,423 B1).

Regarding claims 4 and 9, the battery operated user equipment for use in a radio telecommunications network of Gray et al. in view of Goetz et al. does not disclose means for

Art Unit: 2681

estimating which one of a plurality of available physical channels would best conserve battery charge, and for signaling the identity of that channel to the base station during call set up.

However, Brown et al. discloses means for estimating which one of a plurality of available physical channels would best conserve battery charge, and for signaling the identity of that channel to the base station during call set up (see col. 3, lines 25-44 and fig. 1; sorting a list of available channels based on signal strength to save power battery).

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to provide above teaching of Brown et al. to the method of Goetz in view of Gray et al in order to save power and increase device battery life.

5. Claims 5,10 and 12 are rejected under 35 U.S.C. 103(a) as being unpatentable over Gray et al. (US 6,275,712B1) in view of Goetz et al. (US 6,349,204 B1) and further in view of Katsuki (GB 2337423A).

Regarding claims 5 and 10, the battery operated user equipment for use in a radio telecommunications network of Gray et al. in view of Goetz et al. does disclose including means for estimating whether the available data storage capacity is/are sufficient to allow reception or transmission of each file, with or without a predetermined reserve (see explanation in claims 3). The method does not disclose the state of charge of the battery is/are sufficient to allow reception or transmission of each file, with or without a predetermined reserve, and for denying reception or transmission if the state of charge is insufficient.

However, Katsuki discloses means for estimating whether the state of charge of the battery is/are sufficient to allow reception or transmission of each file, with or without a

Art Unit: 2681

predetermined reserve and for denying reception or transmission if the state of charge is insufficient (see page 6, lines 17 to page 7, line 5 and page 18, line 10 to 21).

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to provide above teaching of Katsuki to the method of Goetz in view of Gray et al in order to inform user that the equipment's battery power is enough to download the file.

Regarding claim 12, Gray et al and Goetz and Katsuki disclose a radio telecommunications network including battery operated user equipment, which equipment includes means for monitoring the state of charge of the battery; a data store; means for configuring the equipment to receive files automatically and store them in the data store, or to retrieve files from the data store and transmit them; and means for monitoring the available data storage capacity of the data store, the network including: means for estimating whether the state of charge of the battery and/or the available data storage capacity is/are sufficient to allow reception or transmission of each file, with or without a predetermined reserve, and for denying reception or transmission if the state of charge or the available data storage is insufficient (see explanation in claims 1-5).

Conclusion

Any inquiry concerning this communication or earlier communications from the examiner should be directed to David Q Nguyen whose telephone number is 703-605-4254. The examiner can normally be reached on 8:30AM-5:30PM.

Art Unit: 2681
